

Procedure Skill vs Ability Skill

The distinction is about invocation, control, and context cost.

procedure skill	ability skill
Invocation	
human chooses when to run it	model may call it itself
Control	
developer stays in the driver seat	agent receives standing capability
Context cost	
description loaded on demand	description can enter context early
Good use	
planning, PRD, issue splitting, grill-me	coding standards, local conventions
Risk	
manual trigger discipline required	many descriptions crowd the prompt

Design heuristic: keep repeated human judgment as a procedure; reserve ability skills for rules the agent must notice by itself.
