

Policy input checklist

A backend decision needs more than possession of a shared credential.

Input	Decision question	Observable evidence
Subject	Who initiates the request?	user id, agent id, service identity
Action	What operation is requested?	read, update, approve, change-password
Resource	What is being touched?	record, API, workflow, database
Context	What runtime facts matter?	session, device, network, risk, time
Delegation evidence	Can the agent act for the user?	scope, consent, chain, expiry
Request purpose	Why is the action being taken?	ticket, task, business objective
Policy source	Which rule set governs it?	ABAC attributes, PBAC rules, compliance
Observable evidence	What can be audited?	decision, reason, traces, backend result

These fields let ABAC/PBAC evaluate the request before the Vault mediates backend access.
