12.6 Move 5: Use Time Comparison for Change Questions	33
12.7 Move 6: Upgrade Vocabulary Through Function	33
12.8 Move 7: Avoid Common Part 3 Weaknesses	33
12.9 Practice Checklist	34

1 How to Use Part 3 Topic Frameworks

1.1 Why This Note Uses Frameworks

IELTS Speaking Part 3 is broad by design. The speaker's opening premise is practical: a season can contain hundreds of possible Part 3 questions, so learners cannot prepare by memorising every answer one by one (00:00:09–00:00:19). A stronger strategy is to build transferable topic frameworks: ideas, examples, sentence patterns, and evaluation language that can be adapted when the exact wording changes.

Core Preparation Principle

The goal is to enter Part 3 with something to say, some ideas to develop, and some expressions ready to use. The same framework can support several related questions if the learner adjusts the angle, scope, and example.

This note therefore treats each topic as an answer toolkit. For each chapter, the useful unit is:

- a common Part 3 question type;
- a model answer move, such as qualified agreement, balanced evaluation, or example compression;
- reusable expressions from the speaker's English answer;
- a short learner note explaining why the answer sounds mature.

1.2 Reusable Answer Moves

Part 3 Abstraction

Part 3 rewards flexible abstraction. A learner should move from personal opinion to broader groups, institutions, trends, and consequences: students, children, schools, workplaces, companies, governments, families, and society.

- Use a direct stance first: “Yeah, I think so,” “Definitely,” “Honestly,” or “It depends on the situation.”
- Add scope control: “usually,” “some of them,” “in some cases,” “to some extent,” or “as long as.”
- Give one concrete example instead of listing many weak points.
- End with a value judgment, a consequence, or a practical boundary.

Figure 1: Opening topic family: Education and Personal Growth.¹

2 Education and Personal Growth

2.1 Foreign Languages Among Young People

The first topic opens with a generalisation about language learning among young people. The useful answer begins with a clear claim, then gives reasons: “English is by far the most common foreign language” because it is taught from a young age, and globalisation has also made languages such as Korean and Spanish more visible (00:01:52–00:02:19).

Social Explanation

A Part 3 answer often needs a social explanation rather than a personal preference. Here, the speaker links language learning to school systems and globalisation, which makes the answer broader and more exam-ready.

Reusable phrases:

- “especially among younger people”
- “by far the most common foreign language”
- “taught in schools from a fairly young age”
- “because of the impact of globalisation”

2.2 How Speaking Another Language Helps at Work

The prompt appears in the transcript as a truncated question: “speaking other languages help at work?” The intended question is clearly about whether foreign-language ability helps in the workplace (00:02:19). The answer uses a simple benefit chain:

¹Source video frame: 00:01:52. Nearby subtitle interval: 00:01:47.100–00:02:03.900.

Language skill → standing out → international work → direct communication

The speaker says that being able to speak another language can “make you stand out from other candidates” and create opportunities to work with “international clients or overseas teams” (00:02:25–00:02:35). The example is compact: some people got promotions because they could communicate with foreign customers “without needing a translator” (00:02:36–00:02:43).

Career Value

For career questions, a strong answer connects a personal skill to workplace value: employability, client communication, promotion, teamwork, and organisational impact.

2.3 Children, Adults, and the Learning Process

For the question “Why is it easier for children to learn than adults?” the answer compares emotional barriers and exposure (00:02:45–00:03:17). Children are “less afraid of making mistakes,” while adults “often overthink everything.” Children also have frequent learning opportunities, so the process feels “more natural rather than stressful.”

Mechanism Over Age

Avoid reducing this answer to a claim about age alone. The stronger explanation is mechanism-based: fear of mistakes, willingness to try, overthinking, daily exposure, and the emotional atmosphere of learning.

Useful answer structure:

- Name the psychological factor: fear of mistakes.
- Name the behavioural result: children are more willing to try.
- Add the environment: daily exposure makes the process natural.
- Give a contrast with adults: overthinking makes learning stressful.

2.4 Consistency in Language Learning

When asked about the most important thing for learning a language, the speaker answers directly: “Honestly, consistency” (00:03:17–00:03:23). The answer then challenges a common learner habit: many people search for the perfect method, while regular exposure has greater long-term value. The core phrase is memorable: “language learning is usually more like a marathon than a sprint” (00:03:38–00:03:46).

Consistency Principle

High-score answers often turn a simple question into a principle. Here, the principle is that small, repeated practice compounds over time.

Reusable phrases:

- “regular exposure matters much more”
- “20 or 30 minutes a day”
- “make a huge difference over time”
- “more like a marathon than a sprint”

2.5 Schools, Intelligence, and Independent Thinking

The school question asks how important it is for schools to help children become smarter (00:03:46–00:03:50). The answer defines “smart” before judging it: if smart means being flexible and creative, then schools should develop “critical thinking” and “the ability to solve problems” (00:03:50–00:04:04). This is stronger than treating intelligence as grades only.

The next prompt asks when children begin to form their own opinions (00:04:16–00:04:20). The answer gives a cautious timeline: it “usually starts quite early, probably in kindergarten,” when children meet more people outside their families and encounter different ideas. At first, opinions are influenced by parents and teachers; over time, children develop “their own way of seeing the world” (00:04:20–00:04:41).

Definition Before Judgment

Definition before judgment is a useful Part 3 move. If a question contains a vague word such as “smart,” “successful,” or “good,” define the word first, then answer.

2.6 Reusable Answer Moves

- **Social cause move:** connect behaviour to schools, globalisation, or daily exposure.
- **Career value move:** explain how a skill makes a candidate stand out and creates work opportunities.
- **Mechanism comparison:** compare children and adults through fear, confidence, and exposure.
- **Principle answer:** answer with a compact rule such as “consistency” and support it with a concrete routine.
- **Definition first:** define an abstract word before giving an opinion.

· Are there many people who can speak foreign languages in your country?
中国有很多人会说外语吗?

Yeah, especially among younger people. English is by far the most common foreign language because it's taught in schools from a fairly young age. And also I think because of the impact of globalization, it's becoming more common for people to learn languages like Korean or Spanish.

是的，尤其是在年轻人当中。英语绝对是最普遍的外语，因为很多人从小就在学校学习英语。在一些大城市里，也越来越多人开始学习韩语或者西班

²Source video frame: 00:02:15. Nearby subtitle interval: 00:01:52.100–00:02:19.379.

3 Technology and Digital Life

3.1 AI Advantages: Time, Starting Points, and Better Work

The AI section begins with a direct advantage question: “What are the advantages of AI?” (00:04:46–00:04:49). The speaker gives a broad claim first: “the biggest advantage is that AI saves people a lot of time.” Then the answer explains the mechanism: AI can handle repetitive tasks faster than humans, such as organising information or answering simple questions (00:04:49–00:05:03).

The example is personal and practical: using AI to brainstorm ideas for homework gives a starting point within seconds (00:05:03–00:05:14). The answer then generalises: AI allows people to focus more on “creative or meaningful work” (00:05:14–00:05:21).

Function-to-Value Chain

A strong technology answer can follow this chain: function, saved effort, personal example, broader value. This prevents the answer from becoming a list of disconnected benefits.

3.2 AI Risks: Resources, Judgment, Jobs, and Asymmetry

For the disadvantages of AI, the speaker avoids a single predictable point and names several risks (00:05:21–00:06:13). The first is environmental cost: AI uses electricity and water, which is “quite concerning” when resources are spent generating trivial outputs. The second is ethical: AI lacks human judgment while replacing jobs that require experience. The third is economic: productivity gains can be asymmetric, because the people who benefit from increased productivity may differ from the people whose work is displaced.

Asymmetric Gains

“Asymmetric” means unevenly distributed. In this answer, productivity may increase overall, yet the benefits and losses can fall on different groups. A simple way to model this is:

$$\Delta P > 0, \quad \Delta B_i \neq \Delta B_j$$

where ΔP is total productivity gain, and $\Delta B_i, \Delta B_j$ are the benefits received by different groups.

Useful expressions:

- “how much electricity and water it uses”
- “quite concerning”
- “ethical issue related to AI”
- “doesn’t really have human judgment”
- “who reaps the fruit of this increased productivity”
- “very asymmetric”

3.3 AI Literacy for Children and Students

The question “Should children learn to use AI?” receives a careful answer: AI literacy is important because AI is already part of life (00:06:13–00:06:36). The speaker’s point is that children should learn to use AI critically: how it generates information, who decides what information is allowed, and what happens when systems fail.

AI Literacy Trap

The learner should avoid a simple “children should use AI for homework” answer. The mature angle is AI literacy: understanding, questioning, and evaluating the tool.

For student reliance, the answer begins with a hedged stance: “Honestly, some of them are” (00:06:39–00:06:44). The example is familiar: students use AI for writing essays and answering homework questions. The deeper concern is the loss of the thinking process: learning involves “struggling a little bit and figuring things out,” and if AI does all the work, that process can disappear (00:06:53–00:07:06).

3.4 Messaging, Calling, and Communication Pressure

The digital-life topic then shifts from AI to communication habits. When asked why some people prefer messaging to calling, the speaker uses a personal-to-general bridge: “I totally understand that because I’m a bit like that myself” (00:07:08–00:07:16). The answer explains control: messages let people reply when they are free and think about what they want to say, while phone calls feel immediate and can be tiring if someone is busy or in the wrong mood (00:07:16–00:07:31).

Delayed replies get a balanced explanation. People may be busy, may want to respond properly later, may lack the right words, or may simply get distracted and forget (00:07:34–00:07:56). The speaker adds a useful boundary: delayed replies do not always mean someone is rude or ignoring the other person (00:07:56–00:08:01).

Communication Meaning

For online communication questions, the best answer usually separates information from emotion. A message carries content, timing, attention, and social meaning.

3.5 Why Delayed Replies Feel Personal

The final prompt in this window asks why people become upset when others do not reply (00:08:20–00:08:24). The answer gives a clean psychological explanation: communication is about feeling acknowledged as well as exchanging information. A long silence can make people overthink and wonder whether they have done something wrong (00:08:24–00:08:43).

This is a high-value Part 3 move because it turns a small daily behaviour into a broader claim about social expectations and emotional interpretation.

3.6 Reusable Answer Moves

- **Function-to-value chain:** AI saves time, handles repetitive work, gives a starting point, and frees attention for creative work.
- **Risk layering:** mention environmental cost, ethical judgment, job replacement, and unequal gains.
- **Critical literacy move:** say children should learn how a tool works and when to question it.
- **Personal-to-general bridge:** begin with a small personal admission, then generalise to people’s need for control and time.
- **Emotion behind behaviour:** explain that delayed replies can feel like lack of acknowledgement.

· What are the disadvantages of AI?

AI有什么劣势?

I think, to me, is how much electricity and water it uses. It is quite concerning that we are wasting so many resources sometimes to generate some silly jokes. Another thing is the ethical issue related to AI. It doesn't really have human judgment, but it is replacing a lot of jobs that require human experience, which is quite unsettling to me. And also, even though we are saying it saves time so it allows people to do better work, in reality it is replacing a lot of jobs in very high-end positions as well, and who reaps the fruit of this increased productivity is very asymmetric.

我认为，最令人担忧的是它消耗了多少电力和水。我们有时为了制造一些搞笑的笑话而浪费如此多的资源，这着实令人担忧。另一个问题是人工智能的伦理问题。它并不具备人类的判断力，却正在取代许多需要人类经验的工作，这让我感到非常不安。而且，尽管我们说它节省了时间，使人们能够更好地工作，但实际上它也取代了许多高端职位，而生产力提高带来的成

Figure 3: AI disadvantages: resource use, ethics, job replacement, and unequal benefits.³

4 Work and Success

4.1 Children's Ambitions

The section starts with the question “Why should children have ambitions?” (00:08:52–00:08:58). The answer gives a clear benefit: ambitions give children “a sense of direction.” When young people have a goal they are excited about, they are usually more motivated to learn skills and work hard (00:08:58–00:09:07).

The answer then adds a humane boundary: ambitions can change, and that is normal. Having a goal encourages growth and exploration, yet every child does not need a grand ambition. Wanting “to live a peaceful and happy life” is also valid (00:09:07–00:09:27).

Ambition With Boundaries

This is a balanced answer without sounding mechanical: ambition gives direction, while a peaceful life remains a legitimate value. The answer respects different life choices.

4.2 Healthy Ambition

For “Is it good to be ambitious?” the speaker uses qualified agreement: “Yeah, I think so, to some extent” (00:09:27–00:09:34). Ambition can push people to improve themselves and achieve things they might otherwise miss. The limitation is balance: obsession with success can damage health, happiness, and relationships (00:09:34–00:10:05).

The strongest point is irreversibility. Some people assume they can rest after achieving a goal, while harm to health and relationships may already be difficult to repair.

³Source video frame: 00:06:00. Nearby subtitle interval: 00:05:22.400–00:06:13.600.

Balance Ambition

For success topics, avoid praising ambition without limits. IELTS Part 3 often rewards mature boundaries: health, relationships, responsibility, values, and long-term cost.

4.3 High Positions and Recognition

The question “Why do people want high positions?” receives a multi-cause answer (00:10:05–00:10:08). Some people want higher salary and a better lifestyle. Others enjoy making decisions and having a bigger impact on an organisation. Many also see promotion as proof that hard work has been “recognized and appreciated” (00:10:08–00:10:31).

This answer works because it groups motives rather than treating everyone as identical:

- material motive: salary and lifestyle;
- agency motive: decisions and impact;
- emotional motive: recognition and appreciation.

4.4 Industry, Opportunity, and Skill

When asked which industries are easiest to succeed in, the speaker resists overclaiming: “Honestly, I don’t think any industry is truly easy” (00:10:31–00:10:48). Technology and AI may have many opportunities because they are growing quickly, yet success still depends on skills and how the industry works (00:10:48–00:11:00).

Industry Questions

This is a useful hedge for broad economy questions. The answer can name a trend, such as technology or AI growth, while keeping the claim realistic. Opportunity does not automatically equal easy success.

4.5 Resilience and Job Changes

The resilience prompt asks why some people succeed despite difficulties (00:11:00–00:11:10). The answer highlights persistence: successful people are not always the most talented; often they are the ones who keep going when things get difficult. Entrepreneurs are a good example because many experience failures before building a successful business (00:11:10–00:11:32).

For job changes, the speaker uses an “it depends” answer (00:11:34–00:11:39). If someone feels stuck and is not learning anything new, changing jobs can be positive. The limitation is that changing jobs too frequently can make it harder to develop expertise and rebuild workplace relationships (00:11:39–00:11:59).

4.6 Promotion, Pressure, and Values

The final prompt asks whether getting promoted is always a good thing (00:12:01–00:12:05). The answer begins with “Not necessarily” and then weighs benefits against costs. A promotion often brings higher pay and more influence, which are attractive. It also brings more responsibility and pressure, and some people realise they spend much less time with family or friends (00:12:05–00:12:26).

The final sentence is the real answer: whether promotion is good depends on what someone values most in life (00:12:26–00:12:30).

Promotion Tradeoff

For work-and-success questions, values are the final layer. Salary, status, skill growth, responsibility, health, relationships, and time can point in different directions.

4.7 Reusable Answer Moves

- **Qualified ambition:** ambition gives direction and motivation, while peaceful life goals can also be valid.
- **Cost boundary:** success has hidden costs when health and relationships are sacrificed.
- **Motive grouping:** explain high positions through money, decision-making power, impact, and recognition.
- **Trend with caution:** technology and AI offer opportunities, yet success still depends on skill.
- **Resilience example:** use entrepreneurs and setbacks to show persistence.
- **Values conclusion:** end promotion answers by asking what the person values most in life.

Figure 4: Work and Success topic opening: ambitions as direction and motivation.⁴

5 Family and Education

5.1 Topic Function

This topic tests whether a candidate can discuss parenting without sounding extreme. The strongest answers in this window avoid a single hard rule. They define the issue, add a limit, then give a concrete example: ambitions, decisions, strictness, encouragement, role models, independence, and parental responsibility.

Core Part 3 Skill

Family questions often look personal, yet Part 3 rewards social and developmental reasoning. A good answer explains what children need at different ages, how parents can guide them, and where parental control should stop.

⁴Source video frame: 00:08:53. Nearby subtitle interval: 00:08:52.259–00:09:27.899.

5.2 Supporting Ambitions Without Taking Over

The first prompt asks, “Should parents support children’s ambitions?” (00:12:35–00:12:37). The model answer opens directly: “Yeah, I think they should” (00:12:38–00:12:40). It then gives a clear reason: supportive parents can give children “a lot more confidence to pursue their goals” (00:12:40–00:12:46).

The useful move is the boundary after agreement. The source phrase is: “That said, support doesn’t mean pushing children toward a particular dream” (00:12:46–00:12:51). This is a high-value Part 3 phrase because it separates emotional support from control. The answer then lists practical parental behavior: listen, offer guidance, give encouragement, and allow children to make their own choices (00:12:51–00:13:04).

Reusable Idea

Support can be framed as scaffolding. Like training wheels on a bicycle, parents provide balance at the beginning, then gradually reduce control as the child becomes more capable. This analogy helps candidates explain guidance without making parents sound passive.

Useful phrases:

- “give children confidence to pursue their goals”
- “offer guidance and give encouragement”
- “allow children to make their own choices”
- “discover what is really interesting to them”

5.3 Good Decisions: Define the Moral Term First

The next prompt is, “How can parents help children make good decisions?” (00:13:04–00:13:08). The answer begins by questioning the wording itself: “What is a good decision? Who gets to decide what is the right way to live?” (00:13:08–00:13:17). This is a mature IELTS move because it refuses to treat a vague moral term as obvious.

After defining the problem, the answer gives parents a limited role. They can offer suggestions and guidance on “the most basic right and wrong” while allowing children to explore and develop their own values (00:13:17–00:13:30). The concrete method is Socratic: “What do you think will happen if you do that?” (00:13:30–00:13:35). This question teaches children to predict consequences.

Answer Move: Definition Before Judgment

When a prompt contains a word such as *good*, *right*, *successful*, or *responsible*, a strong answer can first ask what the word means in context. This creates depth before the candidate gives an opinion.

5.4 Strict Parenting and Clear Boundaries

For “Should parents be strict?” (00:13:42–00:13:44), the model answer uses a qualified stance: “to some extent,” especially for safety and basic responsibility (00:13:44–00:13:51). Then it warns that being overly strict can backfire: children may obey at home and become rebellious later (00:13:51–00:14:02).

The best paraphrased phrase here is setting clear boundaries while maintaining open communication (00:14:02–00:14:09). This gives the examiner two sides of the answer: structure and dialogue. The answer also replaces commands with reasons: tell children why a rule exists and listen when they resist (00:14:09–00:14:17).

Common Trap

Candidates often answer strict-parenting questions with a simple yes or no. That sounds immature. A better answer names the domains where strictness is reasonable, such as safety, honesty, and basic responsibility, then explains the risk of excessive control.

5.5 Encouragement, Progress, and Role Models

The encouragement prompt asks, “How can adults encourage children?” (00:14:20–00:14:22). The source answer says encouragement is most effective when it is genuine and focused on effort and progress. This point appears around 00:14:23–00:14:33. The piano example is useful: if a child practices every day, adults can acknowledge the dedication even before the child becomes highly skilled (00:14:33–00:14:45).

The key principle is that growth matters more than the result (00:14:43–00:14:48). This lets a candidate discuss education using process vocabulary: effort, progress, dedication, consistency, and improvement.

Role models then extend the same idea. Children need people “to look up to” (00:14:53–00:14:57), and the role model can be a teacher or an older sibling (00:15:04–00:15:14). The answer avoids celebrity worship by saying children learn through observation: they watch how others behave (00:15:14–00:15:18).

Why the Piano Example Works

The piano example is compact. It shows effort, delayed results, adult feedback, and growth mindset in one picture. IELTS Part 3 examples should work this way: one familiar scene should carry several abstract ideas.

5.6 Independence and Parental Responsibility

The independence prompt receives another age-based answer: “I think so, but it depends on the age” (00:15:20–00:15:28). Very young children still need security, while older children can build confidence through everyday tasks such as managing pocket money or organizing schoolwork (00:15:28–00:15:47).

The final prompt asks, “What responsibilities do parents have in education?” (00:15:54–00:15:57). The answer reduces the issue to one central aim. Parents should raise children to be self-sufficient and happy human beings. They should be able to support themselves and find happiness in their own life (00:15:58–00:16:16).

High-Score Compression

The section’s deepest idea is simple: parents should help children become capable adults. Ambition, decision-making, strictness, encouragement, role models, and independence all point toward self-sufficiency.

5.7 Reusable Answer Moves

- Start with qualified agreement: “Yeah, I think they should,” then add a boundary.
- Define vague moral terms before judging them: “What is a good decision?”
- Use developmental logic: young children need security; older children need responsibility.
- Give practical examples: pocket money, schoolwork, piano practice, teachers, older siblings.
- Replace extreme claims with balanced phrasing: “to some extent,” “it depends on the age,” “over time.”
- End with the larger aim: self-sufficiency, confidence, values, and happiness.

· Should parents support children's ambitions?

父母应该支持孩子的抱负吗？

Figure 5: Family and Parenting: supporting children's ambitions while allowing independent choice.⁵

6 Rules and Society

6.1 Topic Function

This section moves from family rules to public rules. The answer style becomes more institutional: children, workplaces, punishments, technology, lawmakers, governments, environmental regulation, and society. The strongest move is to explain why rules exist before judging whether a rule is fair.

Core Part 3 Skill

Rules-and-law questions require abstraction. The candidate should move from a small example, such as bedtime rules or traffic fines, to a larger social function, such as order, fairness, prevention, rights, and predictable expectations.

6.2 Why Children Resist Rules

The first answer begins directly with the reason children dislike rules: they naturally want freedom and may fail to understand why rules exist (00:16:17–00:16:32). From their perspective, rules can feel like restrictions (00:16:32–00:16:35). The corrected example is a bedtime rule: a child may dislike it because they want to keep playing (00:16:35–00:16:42).

This answer works because it gives the child's viewpoint first, then adds developmental change: as children grow older, they usually understand the reasons behind certain rules (00:16:42–00:16:50).

Perspective-Taking

For IELTS Part 3, perspective-taking means explaining how different groups see the same issue. A child sees a bedtime rule as a barrier to play; a parent sees it as sleep protection; society sees similar rules as order-building habits.

⁵Source video frame: 00:12:36. Nearby subtitle interval: 00:12:35.060–00:13:04.820.

6.3 Workplace Rules: Professionalism and Respect

The prompt “What rules should people follow at work?” appears at 00:16:50–00:16:54. The model answer identifies the core standard: rules should help maintain “professionalism and respect” (00:16:54–00:17:02). It then gives simple workplace examples: arrive on time and treat colleagues fairly (00:17:02–00:17:06).

The answer also mentions newer workplace rules, such as anti-sexism rules, which are “really meaningful and make a difference” (00:17:06–00:17:17). This is useful because it connects ordinary office behavior with social equality. The final hedge is practical: every workplace has its own policies.

Useful workplace vocabulary:

- professionalism
- respect
- arrive on time
- treat colleagues fairly
- anti-sexism rules
- workplace policies

6.4 Punishment as Prevention

The punishment prompt is compact: “What is the purpose of punishment?” (00:17:20). The answer says punishment should help people learn from mistakes rather than simply make them suffer (00:17:20–00:17:34). Its logic is preventive: if people understand consequences, they are less likely to repeat the same behavior (00:17:34–00:17:39).

Traffic fines are the example (00:17:39–00:17:45). They encourage safer driving, and the goal is prevention rather than punishment itself (00:17:45–00:17:52).

Example Compression: Traffic Fines

Traffic fines are an efficient IELTS example because they show law, punishment, prevention, public safety, and behavior change in one familiar case.

6.5 Technology Forces Law to Adapt

The prompt “How does technology affect laws?” appears at 00:17:52–00:17:56. The answer starts with a broad claim: technology develops so quickly that laws often have to evolve to keep up (00:17:57–00:18:04). It then gives modern legal pressure points: online privacy and AI (00:18:04–00:18:20).

The best abstract phrase is that technological progress “creates situations that lawmakers have never encountered before” (00:18:20–00:18:27). This lets the candidate discuss the relationship between innovation and regulation without needing technical detail.

Law as a Slow System

Technology can change in months; laws often change through debate, drafting, court interpretation, and enforcement. This speed gap creates regulatory lag: society faces new behavior before the rulebook is ready.

6.6 Universal Laws and Cultural Difference

The universal-law prompt asks whether there will ever be universally accepted laws (00:18:32–00:18:35). The answer opens with a natural stance marker: “Honestly, I think that’s quite unlikely.” This phrase

appears around 00:18:35–00:18:38. The reason is cultural and moral variation: countries have different cultures and values, so they disagree on many issues (00:18:38–00:18:44).

The answer also handles a possible exception: universal principles such as human rights may exist, yet even human rights can have different definitions in various contexts (00:18:44–00:18:57). The internet example then adds humor and realism: people argue about tiny little things online, so one universally accepted law is unlikely (00:18:57–00:19:11).

Avoid Overclaiming

A candidate should avoid saying every country can share the same law. A stronger answer distinguishes broad principles from detailed legal rules.

6.7 Environmental Laws and National Enforcement

The environmental-law prompt asks what environmental laws already exist (00:19:11–00:19:15). The source answer carefully hedges: “I’m not an expert on environmental protection” (00:19:15–00:19:21). This is useful because Part 3 answers can admit limited knowledge while still giving plausible examples.

The examples are laws that limit industrial pollution, protect forests or national parks, and impose heavy fines on businesses that violate environmental regulations (00:19:21–00:19:38).

The final prompt asks, “Why do societies need laws?” (00:19:42–00:19:46). The answer defines laws as community rules backed by national enforcement (00:19:48–00:19:58). Without laws, it would be difficult to maintain order and protect people’s rights (00:19:58–00:20:03). Laws create a common set of expectations so people know what is acceptable (00:20:04–00:20:15).

Definition of Law

For IELTS purposes, a law can be explained as a rule with public authority behind it. Ordinary rules guide behavior; laws add national enforcement, penalties, and shared expectations.

6.8 Reusable Answer Moves

- Explain the purpose of a rule before judging it.
- Use group perspectives: children, employees, lawmakers, governments, businesses, citizens.
- Give one vivid public example: traffic fines, workplace fairness, online privacy, national parks.
- Hedge expert knowledge honestly: “I’m no expert; the simplest examples are...”
- Distinguish principles from details when discussing universal laws.
- End with social function: order, rights, safety, fairness, predictability.

·How does technology affect laws?

科技如何影响法律?

That's an interesting question. I think in general technology develops so quickly that laws often have to evolve to keep up. For example, issues related to online privacy, AI barely existed a few decades ago. Governments now need new regulations to deal with these challenges. In a way, technological progress constantly creates situations that lawmakers have never encountered before, and they have to make new laws to adapt.

科技发展得非常快，所以法律往往也

Figure 6: Technology and law: new problems force legal systems to adapt.⁶

7 Environment and Sustainability

7.1 Topic Function

Environmental questions reward candidates who can connect daily habits with large-scale responsibility. The answers in this window move between future generations, plastic waste, government regulation, green technology, public awareness, individual habits, corporate responsibility, and incentives.

Core Part 3 Skill

Environmental answers should combine scale. A candidate can start with a daily-life example, such as packaging or public transport, then connect it to governments, companies, future generations, and long-term risk.

7.2 Why Environmental Protection Matters

The prompt “Why is environmental protection important?” appears at 00:20:26–00:20:34. The answer gives two time scales: it affects daily life and the next generation’s life (00:20:26–00:20:39). Then it raises urgency: environmental damage is already happening, especially through global warming and rising sea levels (00:20:39–00:20:51).

This is a strong IELTS answer because it turns an abstract issue into visible consequences. Coastal areas may disappear, and that would create many problems for people (00:20:45–00:20:51).

Scale Ladder

An environmental answer can climb a scale ladder: personal habit → local community → national policy → global consequence. This keeps the answer broad enough for Part 3.

⁶Source video frame: 00:18:00. Nearby subtitle interval: 00:17:45.000–00:18:15.000.

7.3 Common Environmental Problems: Waste and Packaging

The next prompt asks about common environmental problems (00:20:52–00:20:58). The model answer chooses “plastic waste and over-packaging” (00:21:00–00:21:07). The Taobao example makes the point concrete: one tiny item may be wrapped in many layers of packaging (00:21:07–00:21:20).

The answer then adds a system problem: the waste is not recycled very well, and the amount of waste produced is concerning (00:21:20–00:21:32). This is more effective than listing five problems quickly. One detailed example is easier to develop fluently.

Example Strategy

For environmental topics, one specific example often beats a long list. “A tiny online order wrapped in many layers of plastic” is more memorable than simply saying pollution, climate change, and waste.

7.4 Stricter Laws and Realistic Regulation

The government-law prompt asks whether governments should introduce stricter environmental laws (00:21:25–00:21:32). The answer uses careful agreement: they “probably should.” Many people will avoid environmentally friendly choices unless regulation exists (00:21:32–00:21:39). Companies may focus on profit without regulation (00:21:39–00:21:45).

Then the answer adds a necessary limit: stricter rules do not automatically work better (00:21:45–00:21:51). Rules need to be realistic, or people may ignore them completely (00:21:51–00:21:58).

Policy Trap

Avoid saying governments should simply make every rule stricter. Examiners reward practical reasoning. A good policy must be enforceable, realistic, and clear enough for people and companies to follow.

7.5 Technology: From Electric Vehicles to Energy Reminders

The prompt “How can technology help environmental protection?” appears at 00:21:51–00:21:58. The answer starts conversationally: “Quite a lot, actually” (00:21:58–00:22:00). It gives large-scale examples such as electric vehicles and renewable energy, then adds a small-scale example: apps can track electricity usage and remind people when they are wasting energy (00:21:58–00:22:18).

This combination is useful. Electric vehicles and renewable energy sound policy-level; electricity tracking apps sound personal and practical. Together they show range.

Useful technology phrases:

- electric vehicles are becoming more common
- renewable energy is becoming more efficient
- track electricity usage
- remind people when they are wasting energy
- small things can help

7.6 Awareness, Habits, and Unequal Responsibility

For awareness, the source answer says people talk about sustainability much more than they did ten years ago (00:22:18–00:22:29). Reusable cups and shopping bags are everyday evidence (00:22:29–00:22:37). The key hedge is that awareness has increased even if behavior has not fully changed (00:22:37–00:22:44).

For individual action, the answer rejects overnight lifestyle transformation. Small habits already help: reusable water bottles and buying fewer unnecessary things (00:22:44–00:23:02). Then the answer introduces responsibility by scale: big companies and richer people have more responsibility than ordinary people (00:23:02–00:23:17). The cleaned image is a wealthy person’s mansion with water running 24/7, which makes individual efforts feel limited.

Unequal Responsibility

This is a useful ethical idea: responsibility often follows capacity. Ordinary people can change habits, while companies, wealthy consumers, and governments usually have greater resources and a larger environmental footprint.

7.7 Making Green Choices Convenient

The final prompt asks how governments can encourage greener lifestyles (00:23:17–00:23:20). The answer’s best phrase is: “making green choices convenient is more effective than simply telling people what to do” (00:23:20–00:23:27). The public-transport example makes the policy concrete: if public transportation is clean and affordable, more people will naturally use it (00:23:27–00:23:34).

The closing principle is memorable: people respond better when the environmentally friendly option is also the easiest option (00:23:34–00:23:40).

Policy Formula

Effective green policy can be summarized as:

green behavior = convenience + affordability + clear incentives.

This is a speaking-note formula, not a scientific equation. It helps candidates organize a practical answer quickly.

7.8 Reusable Answer Moves

- Start with time scale: daily life now plus future generations.
- Use one concrete problem: plastic waste, over-packaging, rising sea levels, or wasted electricity.
- Balance regulation with feasibility: laws should be strict enough to matter and realistic enough to follow.
- Pair big technology with small technology: renewable energy plus energy-tracking apps.
- Separate awareness from behavior: people may know more before they act more.
- For government prompts, focus on convenience, affordability, incentives, and infrastructure.

Figure 7: Environmental protection as a Part 3 policy and future-generation topic.⁷

8 Advertising and Media

8.1 Topic Function

Advertising and media questions test evaluation language: useful, misleading, memorable, predictable, reliable, convenient, local, international. Strong answers do not treat advertising as purely good or purely harmful. They explain discovery, expectation, influence, attention, and trust.

Core Part 3 Skill

For media topics, the candidate should name the mechanism. Ads work through visibility, emotion, repetition, celebrity influence, storytelling, and social sharing. News choices depend on speed, trust, relevance, and audience age.

8.2 Advantages of Advertisements: Discovery

The opening prompt asks, “What are the advantages of advertisements?” (00:23:43–00:23:47). The answer’s main idea is discovery: advertisements help people discover products and services they might otherwise miss (00:23:47–00:23:54).

The personal example is simple and useful: the speaker finds restaurants and travel destinations through online advertisements (00:23:57–00:24:02). The answer then shifts to business value: ads help businesses reach potential customers, especially smaller companies that people may never hear about without advertising (00:24:02–00:24:11).

Discovery Mechanism

Advertising reduces search cost. Instead of actively looking through thousands of options, consumers are shown products, services, restaurants, or destinations that may match their interests.

⁷Source video frame: 00:20:30. Nearby subtitle interval: 00:20:30.000–00:20:56.000.

8.3 Disadvantages: Incomplete Pictures and Unrealistic Expectations

The disadvantage prompt appears at 00:24:12–00:24:15. The answer states the central problem: advertisements do not always present a complete picture (00:24:15–00:24:21). They highlight the positive side of a product, so people may develop unrealistic expectations (00:24:21–00:24:28).

The personal example is strong because it is relatable: the speaker has bought things because the advertisement made them look amazing, then felt disappointed when they arrived (00:24:29–00:24:38).

Useful Critical Language

Avoid saying advertisements are simply lies. A more precise answer says they are selective: they highlight benefits, hide limitations, and shape expectations.

8.4 Celebrity Endorsements and Social Proof

The prompt “Are celebrity endorsements effective?” appears at 00:24:39–00:24:42. The answer gives qualified agreement: “Yeah, I think they can be” (00:24:42–00:24:43). The mechanism is fan loyalty. Celebrity endorsements can be extremely effective for idol fans (00:24:43–00:24:47).

The example is vivid: fans may buy large amounts of products because their favorite celebrity endorsed them, even if they do not need those products (00:24:47–00:25:00). Then the answer adds a personal boundary: celebrity endorsements do not work on everyone; some consumers care more about real customer reviews (00:25:00–00:25:08).

Two Kinds of Trust

Celebrity endorsement relies on borrowed trust: fans transfer positive feelings from the celebrity to the product. Customer reviews rely on user evidence: buyers trust people who have actually used the product.

8.5 Successful Ads: Memory, Emotion, and Sharing

The success prompt asks, “What makes an advertisement successful?” (00:25:08–00:25:11). The answer says the best advertisements are memorable (00:25:11–00:25:14). Since people see hundreds of ads every day, an ad must make someone laugh, remember a catchy slogan, or feel entertained enough to share it with friends (00:25:14–00:25:33).

This answer gives a clear chain:

attention → memory → sharing → reach.

Again, this is an answer-planning formula. It helps candidates explain why an ad succeeds.

Useful phrases:

- “make someone laugh”
- “remember a catchy slogan”
- “become popular online”
- “entertaining enough that people willingly share it”
- “grab attention quickly”

8.6 Boring Ads and Short Attention Spans

The prompt “Why are some advertisements boring?” appears at 00:25:33–00:25:36. The answer says they feel too predictable (00:25:37–00:25:39). Some ads focus so much on selling a product that they forget to tell an interesting story (00:25:39–00:25:46). As a result, people lose interest within seconds (00:25:46–00:25:50).

The short-attention-span idea is exam-useful: nowadays people can skip weak ads quickly, so an advertisement has to grab attention early (00:25:50–00:25:58).

Story Beats Hard Selling

In speaking terms, this means a candidate can evaluate ads through narrative. A predictable product pitch often feels forgettable; a story, joke, emotion, or surprising image gives people a reason to keep watching.

8.7 Newspapers, Phones, and News Preference

The newspaper prompt is partially implied in the transcript. The answer says some people still read newspapers, though it is much less common than before (00:26:02–00:26:06). Most people gather news from their phones because phones are faster and more convenient (00:26:06–00:26:11). Newspapers still have an audience, especially among older generations, and some people see traditional newspapers as more reliable than social media (00:26:12–00:26:22).

The final prompt asks whether people prefer local news or international news (00:26:23–00:26:26). The answer uses relevance as the criterion: people pay closer attention to what affects their lives directly (00:26:28–00:26:32). Local news relates to transportation and community events; major international news attracts attention when it affects the economy or global politics (00:26:32–00:26:51).

Media Evaluation Axis

News preference can be explained through four axes: speed, reliability, relevance, and audience. Phones win on speed; newspapers may win on perceived reliability; local news wins on daily relevance; international news wins when the consequences are large.

8.8 Reusable Answer Moves

- For advantages, use discovery: ads help people find products, services, restaurants, and destinations.
- For disadvantages, use selectiveness: ads show the positive side and can create unrealistic expectations.
- For endorsements, compare celebrity influence with real customer reviews.
- For successful ads, explain attention, memory, emotion, slogans, and sharing.
- For boring ads, mention predictability, weak storytelling, and short attention spans.
- For news, compare speed, reliability, age groups, local relevance, and global impact.

Figure 8: Advertising and Media: advertisements as discovery and business communication.⁸

Figure 9: Local versus international news: relevance, community, economy, and global politics.⁹

9 Travel and Tourism

9.1 Holiday Length: Give a Personal Benchmark, Then Generalize

The prompt “What is the ideal length of a holiday?” (00:26:55) is a preference question, yet the answer works because it gives a concrete benchmark and explains the tradeoff:

⁸Source video frame: 00:23:45. Nearby subtitle interval: 00:23:41.000–00:24:05.000.

⁹Source video frame: 00:26:30. Nearby subtitle interval: 00:26:23.900–00:26:51.579.

Core answer move

Choose a practical range, explain the two extremes, then state the balanced middle.

too short → no real relaxation
too long → missing routine
one or two weeks → enough time to explore

Useful source phrasing:

- “For me, about one or two weeks is perfect” (00:26:57).
- “A long weekend is nice, but it always feels like it is over just when you are starting to relax” (00:26:57).
- “I usually start missing my own bed and my daily routine” (00:27:05).
- “A week or two gives you enough time to explore without feeling completely disconnected from real life” (00:27:11).

Learner note: this is stronger than saying “I like long holidays.” It names the pressure on both sides: relaxation time versus normal-life connection.

9.2 Planning Holidays: Social Media, Bookings, and Spontaneity

For “How do people plan holidays?” (00:27:17), the answer starts with a current social habit and then adds a personal twist:

- “These days most people start with social media” (00:27:23).
- “They will see a beautiful photo or a travel vlog and suddenly decide that is where they want to go” (00:27:31).
- “They usually look up everything they need to book, like hotels and flights” (00:27:37).
- “I kind of want to go on more spontaneous trips” (00:27:42).

The vivid example is especially useful: going to “a restaurant or a bar” and asking “the coolest person in the room for recommendations for next stops” (00:27:49). It turns an abstract idea, spontaneity, into a memorable action.

9.3 Advance Planning: Seasonal Risk and Flexible Space

The prompt “Is it important to plan holidays in advance?” (00:28:02) invites a yes/no answer. The model answer uses qualified agreement:

- “Yeah, especially if you are traveling during a busy season” (00:28:04).
- “Flights can become ridiculously expensive and hotels may be fully booked” (00:28:10).
- “That said, I do not think every detail needs to be planned” (00:28:19).
- “Some of my favorite travel memories came from random decisions that were not on the itinerary at all” (00:28:22).

This answer pattern is:

agree + condition + practical risk + flexibility boundary.

Use it when a Part 3 question asks whether something is “important,” “necessary,” or “better.”

9.4 Why People Travel: Culture, Food, Perspective, and Routine

For “Why do people travel?” (00:28:30), the answer gives two reasons:

1. Cultural exposure: “experience different cultures,” “try local food,” and “see how people live in other parts of the world” (00:28:32–00:28:41).
2. Psychological refresh: “people simply need a break from their routine and do something different” (00:28:48).

The phrase “there is not just one way to live” (00:28:43) is a high-value Part 3 line because it moves from travel as entertainment to travel as perspective-building.

9.5 Tourism Controversy: Economic Benefits and Local Pressure

The answer around 00:28:56 frames tourism as “pretty controversial.” This is a mature Part 3 move: tourism is treated as a social issue involving local residents, housing, jobs, businesses, and cultural exchange.

- Local concern: tourists can push housing prices higher (00:29:00–00:29:09).
- Economic value: tourism “creates jobs” and hotels, restaurants, and tour companies can all benefit from visitors (00:29:12–00:29:20).
- Cultural value: tourism helps people learn about “different cultures and ways of life” (00:29:20).

Learner note: controversy questions reward balanced social reasoning. A strong answer should identify who benefits and who bears the cost.

9.6 Attractive Destinations and Tourism Change

For “What makes a destination attractive?” (00:29:27), the answer avoids a one-factor explanation:

- “Beautiful scenery definitely helps” (00:29:29).
- Places also become popular because of “great food” or “interesting history” (00:29:33).
- Some cities feel special because of “the streets and local culture” (00:29:45).

For “How has tourism changed over time?” (00:29:51), the answer uses a clear past-present comparison:

- “Years ago, people relied on guidebooks like Lonely Planet” (00:29:58).
- “Now you can plan an entire trip from your phone while lying in bed” (00:30:03).
- “A place becomes famous almost overnight because a few videos go viral online” (00:30:09).

9.7 Reusable Answer Moves

Travel and tourism moves

- Use a range: “about one or two weeks” sounds natural and defensible.
- Explain extremes: too short for relaxation, too long for routine.
- Add a social trend: social media, travel vlogs, viral destinations, phone-based planning.
- Balance preparation and flexibility: book essentials early, leave space for random discoveries.

- For controversy, map stakeholders: tourists, local residents, hotels, restaurants, tour companies, and cultural communities.
- Use concrete evidence: guidebooks, Lonely Planet, viral videos, housing prices, local food, and street culture.

Figure 10: Travel and Tourism: why people travel and how tourism creates broader effects.¹⁰

10 Home and Community Life

10.1 Home Visits: Hospitality and Relationship Distance

The prompt “Do Chinese people like visiting others’ homes?” (00:30:18) is answered through cultural generalization with careful hedging:

- “Yeah, I think so” (00:30:22) gives a direct stance.
- Chinese people are described as “very hospitable and friendly” (00:30:22).
- Inviting someone home is presented as “an ultimate gesture of showing friendliness” (00:30:28).
- “It probably happens less often than before” (00:30:34) adds social change.
- Being invited into someone’s home usually means “a fairly close relationship” (00:30:41).

Learner note: this answer works because it connects a daily habit to a cultural meaning. In Part 3, a home visit is more than an activity; it signals hospitality, trust, and social closeness.

¹⁰Source video frame: 00:28:30. Nearby subtitle interval: 00:28:30.400–00:29:27.139.

10.2 What People Do When Visiting

For “What do people do when visiting others?” (00:30:46), the answer gives simple actions and then attaches cultural value:

- “Sit around, chat and catch up on each other’s life” (00:30:49).
- “If it is a family gathering, food is usually the main event” (00:30:55).
- “Sharing a meal is a big part of spending time together” (00:30:55).
- Bring “a box of fruit or some drinks” as “a polite gesture” and “a way of saying thanks for the invitation” (00:31:01–00:31:13).

The example “a box of fruit” is valuable because it is small, concrete, and culturally recognizable. It prevents the answer from becoming vague.

10.3 City and Countryside Homes: Control the Scope

The prompt “What are the differences between city and countryside homes?” (00:31:14) could tempt a learner to overgeneralize. The model answer controls the scope:

Scope-control phrase

“It depends on which country we are talking about” (00:31:18).

The answer then compares China and the United States:

- In big Chinese cities, homes are often apartments and “space can be quite limited because land is expensive” (00:31:23–00:31:29).
- In the countryside, people may live in “larger houses” and may have “their own yard” (00:31:36).
- In the United States, the difference can be less obvious because many city residents also live in “fairly spacious houses,” especially in suburban areas (00:31:42–00:31:48).

Learner note: this is a strong answer move for geography questions. First limit the claim, then compare specific contexts.

10.4 Visiting Gifts: Occasion, Safety, and Politeness

For “What gifts do people bring when visiting?” (00:31:55), the answer uses a safe-choice strategy:

- “It depends on the occasion” (00:31:59).
- “Fruit is probably one of the safest choices in China” (00:31:59).
- “It is quite common to bring a box of fruit when visiting relatives or friends” (00:32:05).
- “Some people also bring snacks or desserts” (00:32:10).
- For a first visit, bringing something small feels “more polite than showing up empty-handed.”
- This visiting-gift point appears around 00:32:14–00:32:21.

The phrase “showing up empty-handed” is useful idiomatic English for social situations.

10.5 Comfort at Home: Memories, Lighting, and Order

The prompt “What makes a home comfortable?” (00:32:21) is answered through emotional and practical dimensions:

- “A lot of it comes down to the memories attached to the place” (00:32:25).
- Happy family moments make people feel “more comfortable and relaxed at home” (00:32:29).
- Practical details also matter: “good lighting” and “a clean, organized space” (00:32:36).
- “A bright, well-lit room can completely change the mood” and make a place feel “warmer and more welcoming” (00:32:46–00:32:53).

This answer is effective because it combines feeling and physical environment:

comfort = memories + family moments + lighting + order.

10.6 Privacy and Neighborhood Relationships

For “Do people prefer privacy today?” (00:32:53), the model answer introduces a modern tension:

- People “definitely value privacy these days” (00:32:56).
- Maintaining privacy is becoming harder because of apps, terms and conditions, and personal data (00:33:00–00:33:12).
- Online behavior tracking adds another layer of pressure (00:33:12–00:33:24).
- Individuals can be careful about posting online and controlling access to personal information.
- There is “only so much individuals can do on their own” (00:33:24–00:33:30).

This is a strong institutional move: the answer shifts from personal caution to tech-company power.

For “How important are neighborhood relationships?” (00:33:30), the answer makes a moderate claim:

- They are “more important than people realize” (00:33:36).
- Many people in big-city apartments do not interact with neighbors every day (00:33:42).
- It is useful to have nearby people to rely on if something unexpected happens (00:33:47).
- Examples: a neighbor can collect a package or watch your home while you are away (00:33:53).

10.7 Reusable Answer Moves

Home and community moves

- Treat home visits as social signals: closeness, hospitality, politeness, and trust.
- Use small cultural examples: a box of fruit, family meals, chatting, and catching up.
- Control broad comparisons with “it depends on which country we are talking about.”
- Explain comfort with two layers: emotional memories and practical design.
- For privacy, move from individual behavior to institutions such as apps and tech companies.
- For neighbors, give ordinary examples: packages, emergencies, and keeping an eye on a home.

Figure 11: Housing and Community: visiting homes as a sign of friendliness and closeness.¹¹

11 Animals, Pets, and Nature

11.1 Teaching Children About Animals

The prompt “Should schools teach children about animals?” (00:34:02) receives a clear stance:

- “Yeah, definitely” (00:34:05).
- Learning about animals helps children “understand the natural world” and “develop empathy at an early age” (00:34:05–00:34:11).
- The answer broadens the frame: human beings are one part of the planet, and animals are “a very important part of our ecosystem” (00:34:11–00:34:21).
- Learning this makes children “less self-centered” (00:34:21).

Learner note: this answer succeeds because it links schools to moral education and ecological awareness. The topic is animals, yet the Part 3 value lies in empathy, responsibility, and systems thinking.

11.2 Pets in Cities: Responsibility Over Location

The likely prompt is whether pets can live well in cities. The answer starts with a condition:

Conditional stance

“I think they can be, as long as owners are responsible” (00:34:28).

Useful source phrasing:

- “Plenty of pets live perfectly happy lives in cities” (00:34:33).

¹¹Source video frame: 00:30:20. Nearby subtitle interval: 00:30:18.939–00:30:45.180.

- The real issue is whether owners have “enough time and energy to take care of them” (00:34:37–00:34:44).
- “Getting a large dog while working 12 hours a day probably is not the best idea” (00:34:44).

This is an excellent answer move for suitability questions:

suitability = environment + owner responsibility + time + energy.

11.3 Advantages of Keeping Pets

For “What are the advantages of keeping pets?” (00:34:52), the answer chooses one main benefit and develops it:

- “One of the biggest advantages is companionship” (00:34:55).
- Pets can make people feel “less lonely,” especially people who live alone (00:34:58).
- The image of coming home after a stressful day to “an excited dog” or “a lovely cat” creates an emotional example (00:35:04–00:35:09).
- The phrase “my own little world that I can relax and be myself” (00:35:09–00:35:15) is especially useful for speaking answers.

The answer then adds responsibility: people should treat pets like “family members.” This point appears around 00:35:21–00:35:26 and prevents the answer from sounding sentimental only.

11.4 Animal Stories: Imagination and Moral Lessons

For “Why are animal stories popular among children?” (00:35:26), the answer gives a child-centered explanation:

- “Animals make stories more fun and imaginative” (00:35:34).
- Children can connect with “a talking rabbit or a brave lion” more easily than with “a regular adult character” (00:35:34–00:35:47).
- Animal stories teach “friendship or kindness” without making the story feel like “a boring lecture” (00:35:47–00:35:54).

This is a strong education answer because it explains the delivery method. Children accept lessons more easily when the lesson is wrapped in imagination.

11.5 Government Protection and Ecosystems

For “Should governments protect animals?” (00:35:55), the answer moves from sympathy to policy:

- Many species face threats from “habitat loss and human activities” (00:35:57–00:36:04).
- “Without protection, some of them could disappear completely” (00:36:04).
- Protecting animals is about “maintaining a healthy ecosystem that benefits everyone, including humans” (00:36:09–00:36:20).

Learner note: this is a high-band move because it explains why animal protection is a public issue. It concerns biodiversity, ecosystems, human behavior, and government responsibility.

11.6 What People Can Learn from Animals

For “What can people learn from animals?” (00:36:20), the answer uses two vivid examples:

- Ants show teamwork: they can “achieve amazing things by working together, despite being tiny creatures” (00:36:27–00:36:36).
- Migratory birds show persistence and adaptability: some travel “thousands of kilometers every year” (00:36:36–00:36:48).

These examples work because they compress a moral idea into a concrete image:

ants → teamwork, migratory birds → persistence and adaptability.

11.7 Changing Attitudes Toward Pets

For “Has people’s attitude toward pets changed?” (00:36:52), the answer uses time comparison:

- “In the past, many people saw pets mainly as animals that served a purpose, such as guarding a house” (00:36:56).
- “Nowadays, pets are often treated more like family members” (00:37:03).
- People may celebrate pets’ birthdays or buy them “fancy clothes” (00:37:07).
- More laws regulate how people treat animals and pets (00:37:12).
- This is described as “a sign of a more civilized society” (00:37:17).

Learner note: the answer combines cultural change and legal change. That makes the response sound broader than a personal pet story.

11.8 Reusable Answer Moves

Animals, pets, and nature moves

- Start with a clear stance: “Yeah, definitely” works for education and protection questions.
- Link animals to larger concepts: empathy, ecosystems, responsibility, law, and social progress.
- Use conditional answers for city-pet questions: pets can thrive if owners have time, energy, and responsibility.
- Give one emotional pet benefit, then add the duty of care.
- Use animal examples as compact moral evidence: ants for teamwork, migratory birds for persistence and adaptability.
- Use past-present comparison for attitude-change questions.

Figure 12: Animals and Human-Nature Relations: animal education, empathy, and ecosystems.¹²

12 Synthesis: Reusable IELTS Part 3 Answer Strategy

12.1 The Core Part 3 Problem

IELTS Speaking Part 3 covers too many possible questions for memorized answers to be reliable. The useful preparation target is a bank of transferable moves: stance, qualification, example, social abstraction, and balanced evaluation. A compact answer can be modeled as:

$$\text{Answer} = S + R + E + A,$$

where S is a stance, R is a reason, E is an example, and A is abstraction into a broader social, cultural, institutional, or technological point.

12.2 Move 1: Give a Direct Stance, Then Limit the Claim

The video repeatedly uses direct openers:

- “Yeah, I think so.”
- “Definitely.”
- “Honestly, some of them are.”
- “I think it depends on the situation.”
- “To some extent.”

The key is avoiding absolute claims. Strong Part 3 answers often use scope control:

- “It depends on which country we are talking about” for city and countryside homes (00:31:18).
- “As long as owners are responsible” for pets in cities (00:34:28).

¹²Source video frame: 00:34:02. Nearby subtitle interval: 00:34:02.339–00:34:25.300.

- “Especially if you are traveling during a busy season” for holiday planning (00:28:04).

This pattern makes the answer sound mature because real social questions depend on context.

12.3 Move 2: Balance Benefits, Costs, and Stakeholders

Many topics in the video work through a three-part balance:

benefit → risk or limit → who is affected.

Examples:

- Tourism creates jobs for hotels, restaurants, and tour companies, yet it can create pressure for local residents through higher housing prices (00:28:56–00:29:20).
- Pets provide companionship, yet owners need time, energy, and responsibility (00:34:52–00:35:26).
- Privacy matters, yet apps and user data collection limit personal control (00:32:53–00:33:12).
- Online tracking extends that pressure beyond what individuals can manage alone (00:33:12–00:33:30).
- Promotions, ambition, AI, advertisements, and strict parenting all follow the same logic: name the upside, name the cost, then explain the boundary.

12.4 Move 3: Use One Concrete Example

The strongest examples are ordinary and visual:

- “A box of fruit” for visiting gifts (00:31:01–00:32:10).
- “Traffic fines” for punishment in society.
- “A bright, well-lit room” for home comfort (00:32:42–00:32:53).
- “Travel vlogs” and viral videos for tourism change (00:27:23–00:30:15).
- “Ants” for teamwork and “migratory birds” for persistence and adaptability (00:36:27–00:36:48).

One vivid example often does more work than three generic reasons. A useful example has:

image + meaning + connection to the question.

12.5 Move 4: Move from Personal Experience to Society

Part 3 rewards abstraction. The answer can begin with personal experience, then widen:

- “At least I start with social media” becomes a broader point about how people plan holidays through photos, travel vlogs, hotels, and flights (00:27:23–00:27:42).
- A personal feeling about lighting becomes a general explanation of comfort and mood at home (00:32:42–00:32:53).
- Enjoying pets becomes a broader discussion of loneliness, responsibility, and family-like treatment (00:34:52–00:35:26).

The structure is:

personal observation → common behavior → larger implication.

12.6 Move 5: Use Time Comparison for Change Questions

For questions about change, the video often uses:

in the past → nowadays → reason or effect.

Good examples include:

- Tourism: guidebooks and Lonely Planet in the past, phone-based planning and viral places today (00:29:51–00:30:15).
- Pets: guarding houses in the past, family-member treatment today (00:36:52–00:37:21).
- Communication, news, environmental awareness, and advertising can use the same structure.

12.7 Move 6: Upgrade Vocabulary Through Function

The best expressions in the video are useful because they perform a speaking function:

- Hedging: “probably,” “usually,” “in some cases,” “to some extent.”
- Contrast and continuation: “That said,” “At the same time,” “However.”
- Social evaluation: “controversial,” “reliable,” “memorable,” “civilized,” “valuable.”
- Cause and effect: “as a result,” “it allows people to,” “that makes,” “without protection.”
- Concrete social language for visits and relationships: “showing up empty-handed,” “catch up on each other’s life.”
- Concrete social language for travel and media: “fully booked,” “go viral online.”

Learners should practise these as answer tools rather than isolated vocabulary.

12.8 Move 7: Avoid Common Part 3 Weaknesses

Common weak patterns

- Giving only a personal preference when the question asks about people, society, schools, governments, workplaces, or technology.
- Making absolute claims about countries, parents, children, tourists, pet owners, or older generations.
- Listing reasons without developing one concrete example.
- Using impressive vocabulary without a clear function in the answer.
- Forgetting stakeholders: local residents, companies, governments, families, children, neighbors, and animal species.

12.9 Practice Checklist

Before answering a Part 3 question

- Can the answer begin with a clear stance such as “Yeah, I think so,” “Definitely,” or “It depends”?
- Has the claim been limited by context, country, age group, season, responsibility, or situation?
- Is there one concrete example that an examiner can picture?
- Does the answer move beyond the speaker’s personal life into society, institutions, or cultural change?
- Is there a benefit-cost balance where the topic requires nuance?
- For change questions, has the answer compared past and present?
- Are useful expressions being practised as answer moves: hedging, examples, cause-effect, contrast, and evaluation?
- Has the answer avoided course-promotion, logistics, and irrelevant closing material?
