

Phoenix experiment run and result

Controlled comparison holds data and evaluator steady while candidate prompt changes.

Run experiment: fixed dataset, async task, same evaluator

```
11 # (filter traces by failing evals -> have as dataset -> name it "dataset-financial-agent-fails")
dataset = Client().datasets.get_dataset(dataset="AIE financial agent failures")
display(dataset)

-- Dataset(id='RGFYWN1d0wPw==', name='AIE financial agent failures', version_id='RGFYWN1d0wPw==248NTg=', examples=6)

And run the experiment!

11 from phoenix.client import AsyncClient

async_client = AsyncClient()
experiment = await async_client.experiments.run_experiment(
    dataset=dataset, task=my_task, evaluators=evaluators, timeout=300
)

-- Experiment started.
View dataset experiments: https://app.phoenix.ai/en/com/s/lyssa/datasets/RGFYWN1d0wPw==/experiments
View this experiment: https://app.phoenix.ai/en/com/s/lyssa/datasets/RGFYWN1d0wPw==/compare/experiments/RGFYWN1d0wPw==/traces
running tasks 66 (100.0%) | 00:50-00:00 | 18.8s
Task runs completed.
Evaluation started.
running experiment evaluations 66 (100.0%) | 00:50-00:00 | 2.8s
Experiment completed: 6 task runs, 1 evaluator runs, 6 evaluations
```

Result: actionability score reaches 1.00 on the failure dataset
