

Where evals run changes the operating model

Phoenix client-side evals vs Arize AX platform-side evals, as described in the workshop Q&A

Phoenix: client-side evals

Notebook / CI / app service

Code eval or LLM judge runs
in team-controlled environment

Results relayed back as
annotations and scores

Arize AX: platform-side evals

Live traces or datasets

Platform scheduler runs
online evaluators

Dashboards, monitoring,
audit and team governance

Decision variables: data boundary | model credentials | schedule | cost owner | version provenance
